XDebbie: one box, zero fuss

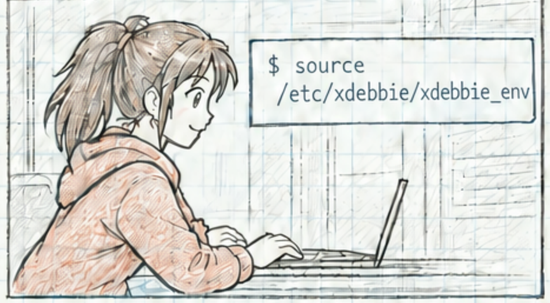

Step 1 — install it

Step 2 — it bootstraps itself

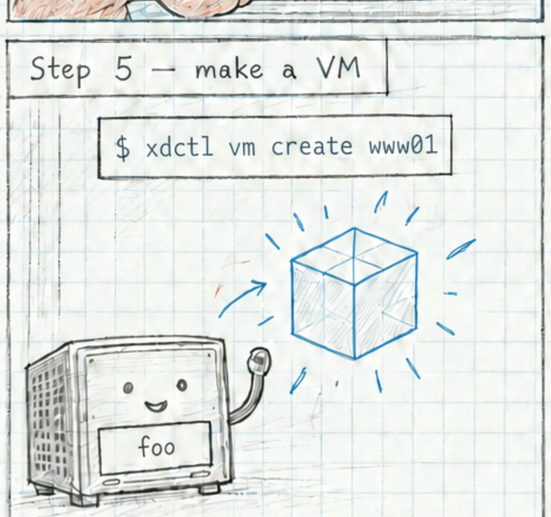

Step 3 — source the env

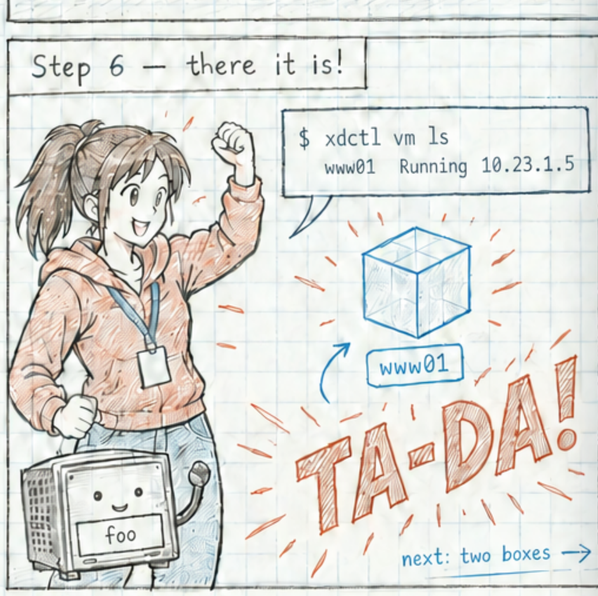

Step 4 — meet your host

Step 5 — make a VM

Step 6 — there it is!

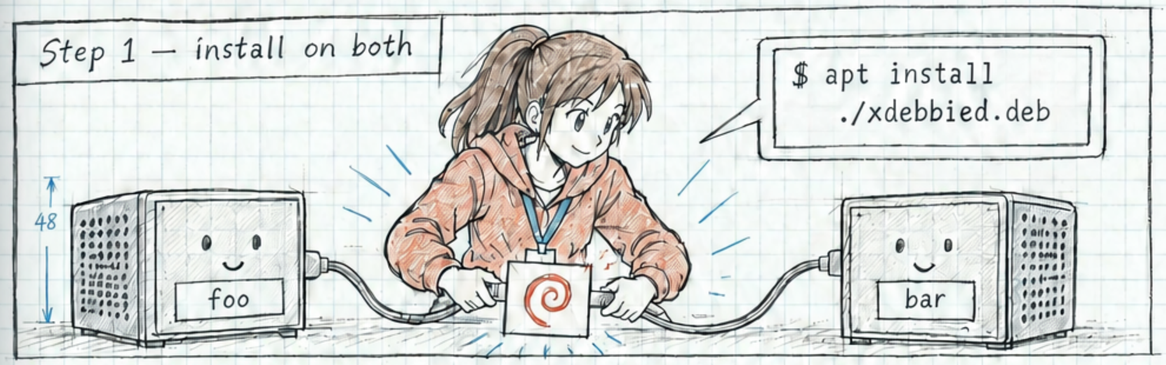

next: two boxes →

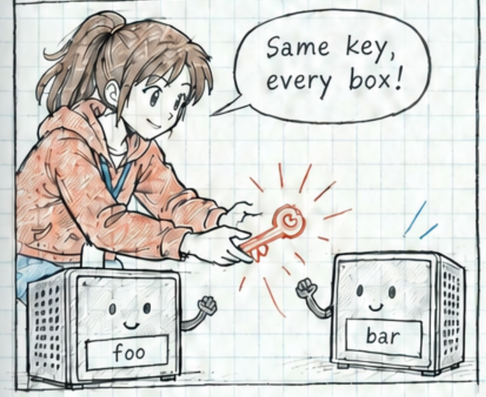

github.com/briankmatheson/xdebbie

XDebbie: two boxes, one cloud

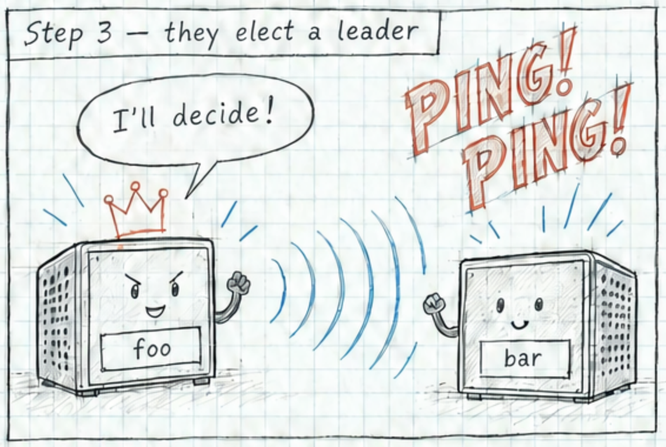

Step 1 — install on both

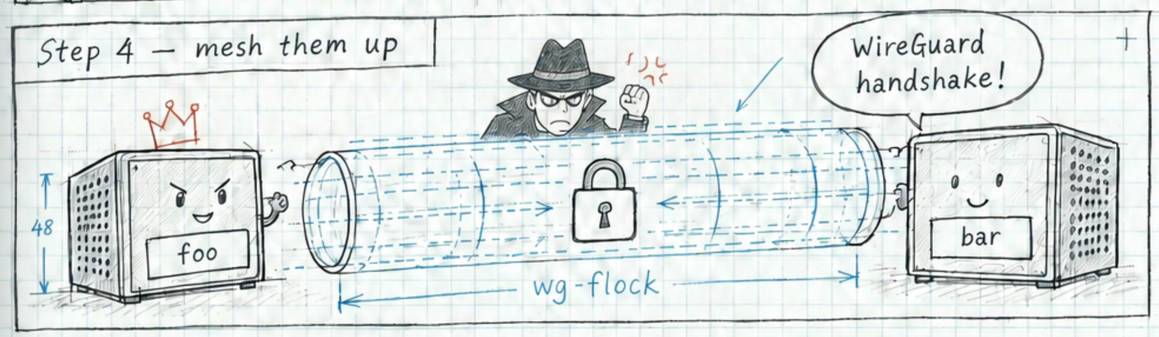

Step 2 — share one token

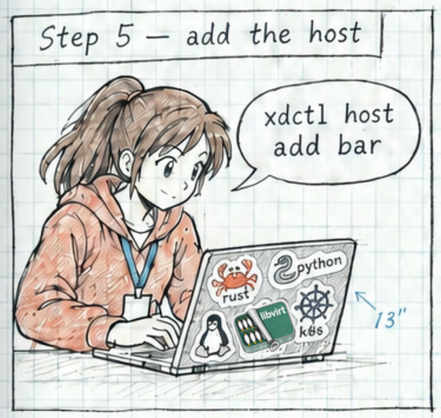

Step 3 — they elect a leader

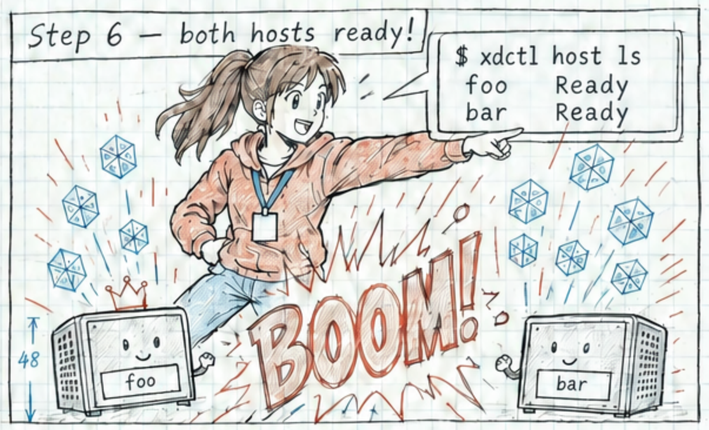

Step 4 — mesh them up

Step 5 — add the host

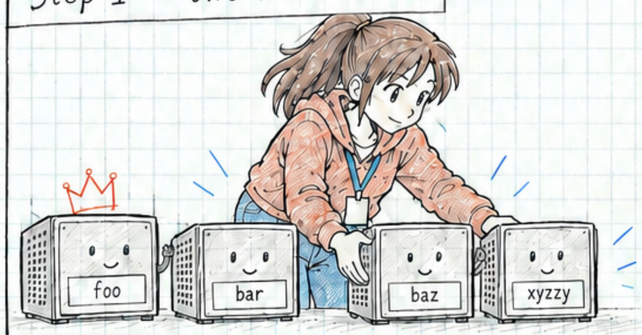

Step 6 — both hosts ready!

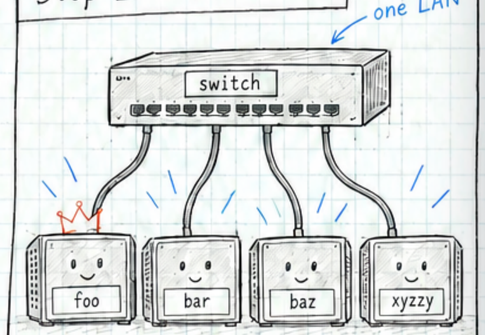

XDebbie: four boxes, one switch

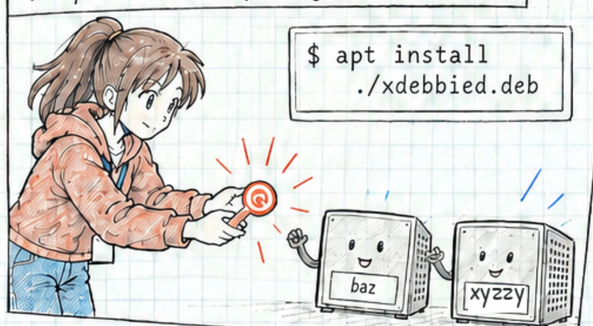

Step 1 — two more boxes

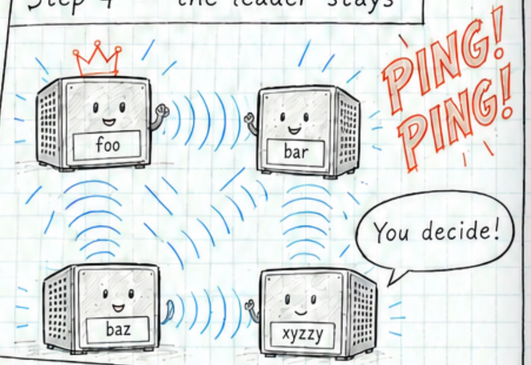

Step 2 — one switch

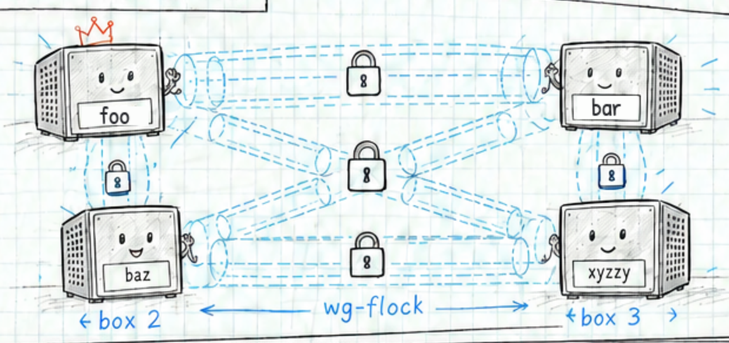

Step 3 — same package, same token

Step 4 — the leader stays

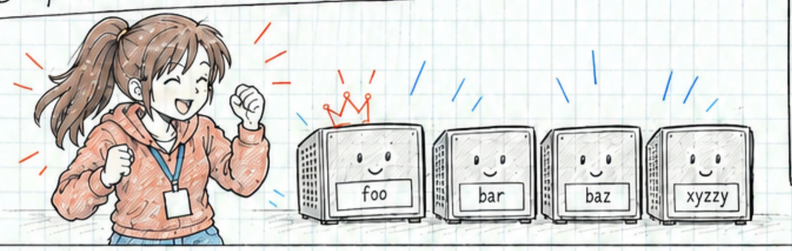

Step 5 — mesh all four

```
$ xdctl mesh wg
$ xdctl mesh peer add 2 --pubkey <baz> --endpoint baz:51820
$ xdctl mesh peer add 3 --pubkey <xyzzy> --endpoint xyzzy:51820
```

Step 6 — four hosts ready!

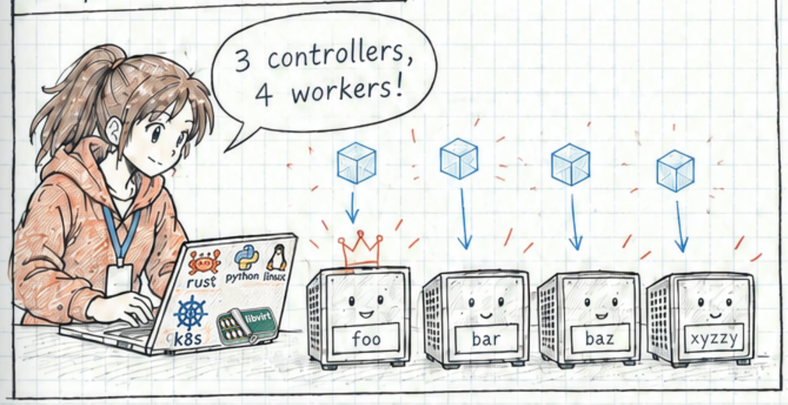

```
$ xdctl host ls
  foo      Ready
  bar      Ready
  baz      Ready
  xyzzy    Ready
```

github.com/briankmatheson/xdebbie

XDebbie: one Kubernetes cluster

Step 1 — make the VMs

Step 2 — seven VMs, four boxes

```
$ xdctl vm ls
cp1    Running    foo
cp2    Running    bar
cp3    Running    baz
wn1    Running    xyzzy
wn2    Running    foo
wn3    Running    bar
wn4    Running    baz
```

Step 3 — Kubernetes is up

```
$ kubectl get pod -n kube-system
cilium-f5rqb                    Running
coredns-589f44dc88-5p19t        Running
etcd-cp1                        Running
kube-apiserver-cp1              Running
kube-vip-cp1                    Running
abe-csi-node-7f6n5              Running
```

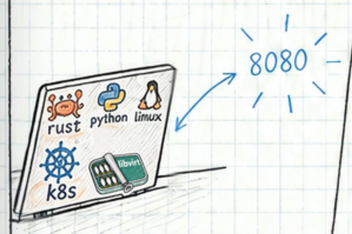

Step 4 — add Headlamp

```
$ helm install my-headlamp
  headlamp/headlamp -n kube-system
```

Step 5 — port-forward

```
$ kubectl port-forward -n
kube-system svc/my-headlamp
8080:80
```

Step 6 — there's your cluster!
